

Continuum is a confidential closing room for private-equity secondaries, built on the Canton Network

We help secondary advisors and fund administrators run continuation-fund closes and settle them in a single atomic transaction.

What a continuation deal is

- 01 A fund is ending; one company is still worth holding.
 - 02 The GP moves it into a new continuation vehicle.
 - 03 Each LP elects: take cash now, or roll into the new fund.
 - 04 A secondary buyer provides fresh capital.
-

The GP is on both sides

The process relies on independent checks so the price and terms don't depend on the conflicted party.

An independent valuer prices the asset

A sealed auction discovers the price

The LPAC reviews fairness and consents

Each LP elects privately

Today, integrity depends on the conflicted party

Leakage	Sealed bids and LP elections sit in a data room the GP controls.
Partial close	The close is separate wires and signatures; one failed leg leaves the deal half-closed.
Unverifiable record	The audit trail is reconstructed afterward from emails and PDFs.

Every check assumes the GP's coordination is neutral.

The same checks, enforced by the ledger

OFF-LEDGER TODAY	ON CANTON
GP-controlled data room	Per-party privacy — each participant is projected only its own slice, by the ledger, not the app.
Separate wires and signatures	One atomic transaction — units, cash, rolled units, burn: all legs or none.
GP coordinates every step	Each party signs with its own key — no shared database under the conflicted party.
Record reconstructed afterward	Four on-ledger proofs — valuation, fairness, consent, auction certificate; anyone entitled can verify.

Native to Canton: sub-transaction privacy · atomic settlement · selective disclosure · no central operator.

CONTINUUMv0.1

GP-LED CONTINUATION DEALS

The entire deal,
in one confidential
workspace

A sealed-bid auction sets the price, investors elect privately,
and every leg settles together — or none do.

Sealed-bid price discovery

Private LP elections

Qualified custodian per seat

All-or-nothing settlement

No keys in the browser

What happens next · gp

Awaiting LPAC consent — it advances the deal so you can open elections.

Participants & visibility

enforced by the ledger, not the app

Seat	Signing custodian	Sees
Advisor / Organizer	Fireblocks — GP Treasury	Deal state, proofs — never sealed bids or elections
Independent valuer	Kroll Valuation Services	Its own valuation and anchor hash only
LPAC oversight	State Street Digital — LPAC	Bid markers, fairness scope — never amounts pre-close
Secondary buyer	Copper — Northbeam Secondaries	Its own bid and leg — no other bids or elections
Exiting LP	Northgate Trust — Calder Family Office	Its own election and cash leg — no peer elections
Rolling LP	BNY Digital — Hawthorn Pension	Its own election and rolled units — no peer elections

CONTINUUM

One deal, end to end

Each view is the ledger's projection of the same nine Daml contracts — Deal · Valuation · Auction · Consent · Election · Clearing · Issuance · Settlement · Registry.

A general engine for multi-party corporate actions

Fund liquidation	A wind-down settles the same way — assets out, cash to LPs, all or none.
NAV fund-finance closes	Multiple lenders commit tranches privately; the drawdown settles atomically.
Tender offers, block crossings	Sealed offers and private elections, settled in one transaction.

Continuation deals are the wedge; the pattern is the same each time.

Thank you

A secure closing room for GP-led continuation deals —
private commitments, four on-ledger proofs,
one atomic close on Canton.

SEAT	CUSTODIAN	SIGNATORY ON	SEES (OBSERVER)
GP	Fireblocks	Deal · Auction · Close	deal state, proofs — never sealed bids or elections
Valuer	Kroll	Valuation	its own valuation and anchor hash
LPAC	State Street	Consent	a scoped fairness view, not the whole book
Buyer	Copper	SealedBid · PSA leg	its own bid and the clearing price
Exiting LP	Northgate	Election · cash leg	its own election and cash leg
Rolling LP	BNY	Election · roll leg	its own election and units

A **signatory** authorizes the contract; an **observer** sees it; everyone else's node never receives it.

MODULE	WHAT IT DOES
Continuum.Deal	Root state machine: opens the room, runs Consented → Electing → Closed, hosts the atomic Close.
Continuum.Valuation	Independent valuer anchors NAV with a real signature; fairness opinion. Self-dealing barred on-ledger.
Continuum.Consent	LPAC fairness review — the signed conflict-waiver the Close consumes.
Continuum.Auction	Sealed bids, each a peer- and GP-blind private contract; a marker leaks only that a bid exists.
Continuum.Election	Per-LP cash / roll choice, private to that LP; a contentless marker feeds aggregates.
Continuum.Clearing	Lead filled to capacity, syndicate pro-rata; asserts the deal is not undersubscribed.
Continuum.Issuance	Antecedent-DAG mint gate: no units until valuation, fairness, consent and auction cert all exist.
Continuum.Settlement	Pre-authorized transfer legs, executed inside the one atomic Close.
Continuum.Registry	Instrument registry + co-signed delegations; mints and reserves CV-unit and cash holdings.
Continuum.Credential	Reusable, revocable Qualified-Purchaser eligibility a returning buyer reuses across deals.
Continuum.Document	On-ledger sha256 anchoring; every document hash flows through hashOf so it re-verifies.
