

A secure closing
room for GP-led
continuation deals.

LPs and buyers commit privately, the system
computes the close, and cash plus fund interests
settle atomically on Canton.

What a continuation deal is.

- 01 A fund is ending; one company is still worth holding.
- 02 The GP moves it into a new continuation vehicle.
- 03 Each LP elects: take cash now, or roll into the new fund.
- 04 A secondary buyer provides fresh capital.

The GP is on both sides.

The process relies on independent checks so the price and terms don't depend on the conflicted party.

All four checks run through a process the GP coordinates.

- An independent valuer prices the asset.
- A sealed auction discovers the price.
- The LPAC reviews fairness and consents.
- Each LP elects privately.

Today, integrity depends on the conflicted party.

Leakage	Sealed bids and LP elections sit in a data room the GP controls.
Partial close	The close is separate wires and signatures; one failed leg leaves the deal half-closed.
Unverifiable record	The audit trail is reconstructed afterward from emails and PDFs.

Every check assumes the GP's coordination is neutral.

The same checks, enforced by the ledger.

OFF-LEDGER TODAY	ON CANTON
GP-controlled data room	Per-party privacy — each participant is projected only its own slice, by the ledger, not the app.
Separate wires and signatures	One atomic transaction — units, cash, rolled units, burn: all legs or none.
GP coordinates every step	Each party signs with its own key — no shared database under the conflicted party.
Record reconstructed afterward	Four on-ledger proofs — valuation, fairness, consent, auction certificate; anyone entitled can verify.

One deal, end to end.

1 Open the room — six parties, each with its own key.	2 Valuation anchored on-chain.	3 Sealed-bid auction, clearing price, certificate.	4 LPAC fairness review and consent.	5 LP elections — cash or roll.	6 Atomic close — units, cash, rolled interests settle together, or not at all.
---	--	--	---	--	--

The close requires four on-ledger proofs: **valuation · fairness · consent · auction certificate**.

Six seats, one atomic close.

- 01 The buyer bids sealed; each LP elects privately. The GP's room reads “**2 of 2 responded**” while its own ledger projection holds **zero** bids and **zero** elections — it counts what it cannot read.
- 02 Four proofs anchor on-ledger — Kroll's valuation, the fairness opinion, LPAC consent, the auction certificate. The issuance gate will not mint until all four exist.
- 03 One **Close** moves every leg and burns both old-fund interests. The settlement-receipt id is **identical in every seat's window** — the same on-ledger contract from the same transaction, not six animations.

Watch it yourself: continuum-custody.fly.dev ↗ — sign in as any seat (gp, buyer, lpExiting, lpRolling, lpac, valuer · password <seat>-demo), in as many tabs as you have sides to check.

CONTINUUM

v0.1

GP-LED CONTINUATION DEALS

The entire deal,
in one confidential
workspace

A sealed-bid auction sets the price, investors elect privately,
and every leg settles together — or none do.

Sealed-bid price discovery

Private LP elections

Qualified custodian per seat

All-or-nothing settlement

Six seats — each signs through its own custodian.

The screenshot shows a web application for 'continuum-custody.fly.dev · buyer'. The Continuum logo is in the top left. The main header displays 'GP-led continuation vehicle' and 'Project Continuum CVI, L.P.'. A progress bar indicates the auction status: 1. Bid open, 2. Price disclosed, 3. Closed. The left sidebar shows 'GP-led continuation vehicle' and 'Meridian Growth Fund III → CV'. The main content area shows 'Secondary buyer — sealed bid, blind to every other buyer'. Below this, there's a section for 'Clearing price — Pending Auction' and a 'Sealed bid' section with the text 'Bid — % of NAV'.

Visibility is enforced by the ledger, not by the application.

A general engine for multi-party corporate actions.

Fund liquidation	A wind-down settles the same way — assets out, cash to LPs, all or none.
NAV fund-finance closes	Multiple lenders commit tranches privately; the drawdown settles atomically.
Tender offers, block crossings	Sealed offers and private elections, settled in one transaction.

Continuation deals are the wedge; the pattern is the same each time.
